IRDMIS Flagging Codes

Acceptable Criteria:

Note: Flagging Codes marked with * were changed effective 1 February 1993!
Flagging Codes marked with ** were changed effective 1 June 1994!

* A Analyte found in trip blank as well as in field samples. The analyte was detected in the field sample and the trip blank for the same cooler. To be used for volatiles only.

B Analyte found in method blank or QC blank as well as the sample. This Code is to be used when an analyte was detected and quantitated at higher-than-normal background levels. For metals in soil, the following rules must be followed:

(1) If the analyte is detected in the method blank, both the field and QC samples are to be flagged.

(2) If the analyte is detected in the QC blank, only the QC samples are to be flagged.

C Analysis was confirmed. This Code is to be used when a confirmation analysis bears out the reported result (if it is above the CRL or MDL). The confirmation analysis must use a different column or analytical technique.

D Duplicate analysis. This Code is used to distinguish analytical results when duplicate analyses are required. Flag only the second (duplicate) sample.

E **No longer in use.**

F Sample filtered prior to analysis. This Code is to be used when results of filtered samples are to be differentiated from non-filtered samples. This Code is also to be used when filtering of samples (as a first step in the sample preparation) is a deviation from the approved method SOP. This Code may be used to indicate both field and laboratory filtering. It is not to be used when filtering the extract is the normal procedure.

* G Analyte found in rinse blank as well as field sample. The analyte was detected in the field sample as well as the day's rinse blank for the same equipment type.

** H **No longer in use after June 1994.**

* I Interferences in sample cause the quantification and/or identification to be suspect. This Code is to be used when matrix interferences may mask detection of the target analyte. Must always be used with Flagging Code J.

*** J Value is estimated because of one of the following conditions:

Interferences in the sample (use Flagging Codes J and I)

or

The value is below the method detection level but above the instrumental detection level (use Flagging Codes J and P)

or

The value is above the upper reporting level of the method (use Flagging Codes J and X).

This Code must always be used with Flagging Code I, P, or X. Both the J and I and J and X combinations may be used both for methods demonstrated under the 1990 QA Program and for methods validated under the 1993

QA Guidelines. The J and P combination is only to be used for methods validated under the 1993 QA Guidelines.

* K Reported results affect by interferences or high background. This Code is to be used when analyte levels at or near the CRL or MDL cannot be accurately quantified down to the CRL/MDL due to interferences. This Code will allow a laboratory to input a higher CRL/MDL, rather than defaulting to the Methods database **(Formerly Flagging Code G)**.

*** L **No longer in use after June 1994.**

** M **No longer in use after June 1994.**

* N Tentatively identified compound (result of GC/MS library search) with a match greater than 70%. To be used when specified in the contract/task order.

* O **No longer in use.**

* P Value is less than method reporting level but greater than the instrumental detection limit. This Code must always be used with J. This Code is only to be used for methods validated under the 1993 QA Guidelines.

* Q Confirmatory analysis was performed; however, sample interference obscured the area where the peak of interest would have appeared. To be used when the peak of interest fell within the retention-time window on the primary column, but the retention-time window on the secondary column was marked by interferences.

R Non-target compound analyzed for but not detected (must be used with a Boolean of ND). This Code is used only for those analytes (in GC/MS methods) which were not performance demonstrated or validated. To be used when specified in the contract/task order.

S Non-target compound analyzed for and detected. This Code is used only for those analytes (in GC/MS methods) which were not performance demonstrated or validated. Also used to report tentatively identified compounds which are quantified against an internal standard. To be used when specified in the contract/task order.

T Non-target compound analyzed but not detected (must be used with a Boolean of ND). This Code is used only for those analytes (in non-GC/MS methods) which were not performance demonstrated or validated.

U Analysis is unconfirmed. This Code is to be used when a confirmatory analysis was performed but does not verify the analytical results from the initial analysis.

V Sample was subjected to unusual storage/preservation condition. To be used when samples are received at the laboratory at greater than 4_ C, or were not correctly preserved in the field.

W Single analyte required from a multi-analyte method. This Code is to be used when field samples are to be analyzed for a subset of the demonstrated/validated analytes.

** X Analyte concentration is above the upper reporting level. This Flagging Code is to be used when analyte concentrations exceed the upper reporting level and the laboratory feels that additionally dilutions are not warranted. This Code is also to be used when no sample or extract remains to make additional dilutions. It must also be used whenever a Boolean of GT is used.

* Y Tentatively identified compound (result of a GC/MS library search) with a match of less than 70%, but peak area is greater than 35% of the internal standard. To be used when specified in the contract/task order.

* Z Non-target compound analyzed for and detected. This Code is used only for those analytes (in non-GC/MS methods) which were not performance demonstrated or validated.

* 1 Result less than the CRL but greater than the Criteria of Detection (COD). Can only be used for methods which were performance demonstrated under the 1990 QA Program.

* 2 Ending calibration not within acceptable limits. This Code is to be used for an analyte for which the ending calibration is still unacceptable after multiple attempts.

* 3 Internal standard(s) not within acceptable limits.

*** 4 Analyte quantitated on the secondary column, when this is not the normal practice.

*** 7 **No longer in use after June 1994.**

** 8 Analyte recovery outside of certified range but within acceptable limits. This Flagging Code is to be used when analyte recoveries exceed the upper limit of the certified range by less then 15% and the laboratory feels a dilution is not warranted. **No longer in use after June 1994 (formerly Flagging Code X).**

** 9 Non-demonstrated/validated method performed for USAEC. This Code is to be used to identify Method 00 or NTAM data which was produced under contract to USAEC.

Acceptable Entries:

A Analyte found in trip blank as well as in field samples.
B Analyte found in the method blank or QC blank as well as the sample.
C Analysis was confirmed.
D Duplicate analysis.
F Sample filtered prior to analysis.
G Analyte found in rinse blank as well as field sample.
I Interferences in sample make quantitation and/or identification to be suspect.
J Value is estimated.
K Reported results are affected by interferences or high background.
N Tentatively identified compound (match greater than 70%)
P Results less than reporting level but greater than instrumental detection limit.
Q Sample interference obscured peak of interest.
R Non-target compound analyzed for but not detected (GC/MS methods).
S Non-target compound analyzed for and detected (GC/MS methods).
T Non-target compound analyzed for but not detected (non-GC/MS methods).
U Analysis is unconfirmed.
V Sample subjected to unusual storage/preservation conditions.
W Single analyte required from a multi-analyte method.
X Analyte concentration is above the upper reporting level.
Y Tentatively identified compound (match less than 70%).
Z Non-target compound analyzed for and detected (non-GC/MS methods).
1 Result less than CRL but greater than COD.
2 Ending calibration not within acceptable limits.
3 Internal standard(s) not within acceptable limits.
4 Analyte quantitated on the secondary column.
9 Non-demonstrated/validated method performed for USAEC.

IRDMIS Data Qualifiers

Acceptable Criteria:

I The low-spike recovery is high. To be used for the single low spike in Class 1 methods and the duplicate low spikes in Class 1P.

J The low-spike recovery is low. To be used for the single low spike in Class 1 methods and the duplicate low spikes in Class 1P.

K Missed holding times for extraction and preparation (Hold Time 1). This Qualifier is automatically set when the extraction/preparation holding time is exceeded. **(Formerly Flagging Code K).**

L Missed holding time for sample analysis (Hold Time or Hold Time 2). This Qualifier is automatically set when the analytical holding time is exceeded. **(Formerly Flagging Code L).**

M The high-spike recovery is high. To be used for the duplicate high spikes in Class 1 and 1P methods. Also to be used for the single spike in Class 1A and 1B methods and for the duplicate spikes in Class 1M methods.

N The high-spike recovery is low. To be used for the duplicate high spikes in Class 1 and 1P methods. Also to be used for the single spike in Class 1A or 1B methods and for the duplicate spikes in Class 1M methods.

O Low spike recoveries excessively different. To be used only for the duplicate low spikes in Class 1P methods.

P High spike recoveries excessively different. To be used for the duplicate high spikes in Class 1 and 1P methods. Also to be used for the duplicate spikes in Class 1M methods.

Q Surrogate(s) in field sample outside of acceptable limits as specified by EPA CLP. To be followed by number of surrogates failing criteria (1 - 9). To be used only for field samples **(Formerly Flagging Code Q).**

R Data is rejected and is not usable.

Acceptable Entries:

1-9 Number of surrogates failing EPA CLP criteria (used with Data Qualifier Q)
I The low-spike recovery is high.
J The low-spike recovery is low.
K Missed holding time for extraction and preparation.
L Missed holding time for sample analysis.
M The high-spike recovery is high.
N The high-spike recovery is low.
O Low spike recoveries excessively different.
P High spike recoveries excessively different.
Q Surrogate recovery outside of acceptable CLP limits (field samples only).
R Data are rejected.

CO-LOCATED SOILS INTERNAL DATA QUALITY ASSESSMENT INFORMATION

This section of the appendix presents the Rust E&I internal Data Quality Assessment (DQA) which is intended to supplement the co-located soils discussion presented in Volume I, Section 4.5 and the Ecochem external DQA.

Soils: Precision in Field Samples. The overall precision of the field QC samples was acceptable. Field duplicates were taken during the collection of the soil samples. Precision for field samples was evaluated by calculating the relative percent difference (RPD) values between primary and duplicate analyses. It should be noted that the calculation of %RPD is only valid if both the primary and duplicate samples are true detects (i.e., no RPD calculation if one or the other is an 'ND' or 'LT').

Detailed RPD tables for the co-located soil samples taken at the ESAs and the RSA are located at the end of the Soil Analytical Results section of this appendix.

Table D-1 shows a comparison of the duplicate %RPDs for metals in soil samples collected from the RSA to those in ESA-1 and ESA-2. The comparison shows good agreement and suggests that sample collection and sample handling did not introduce unacceptable error for these analytes. The sample and its duplicate from the RSA showed only low concentrations of some metals; no dioxins or furans, explosives, pesticides, semivolatiles, or cyanide were detected. All RSA %RPD values for metals ranged from 0 to 16.92 percent except for copper (125.56 percent), which was qualified as an elevated low-spike recovery. Only one duplicate was collected at the RSA for comparison to the samples taken at the ESAs.

Similarly, Table D-2 shows the range and average value of RPDs for the different chemical classes of analytes in primary and duplicate soil samples collected at ESA-1 (SWMUs 42 and 45) and ESA-2 (SWMUs 10/11, 12/15, 21/37, and 1b/1c). The average RPD for the different chemical classes ranged from 13.76 percent to 29.24 percent, showing slightly lower RPDs for metals and pesticides than for semivolatiles, dioxins/furans, and cyanide.

Soils: Precision in Laboratory Analyses. The overall precision of the analytical laboratory QC samples was within the acceptable range. Precision for laboratory analyses was evaluated by calculating the RPD values between matrix spike and matrix spike duplicates (MS/MSD) in soil samples collected from the field. The USAEC USATHAMA program uses the term '*natural matrix spike*' for the term 'matrix spike'. A matrix spike is an aliquot of the primary sample spiked with a known amount of the target analyte(s) and surrogate compounds (for organic analyses). Cyanide and metal analyses do not use surrogate compounds. There were no data qualifiers for any of the detected analytes in the soil samples spiked with surrogate compounds. In addition, no cyanide or explosives were detected in the MS/MSD pairs spiked with surrogate compounds. Additional information may be found in the EcoChem DQA located in Appendix G.

The analytical precision for the pesticides met acceptable criteria. RPDs are summarized in Table D-3 for pesticide analytes in samples spiked with surrogate compounds. Proper laboratory preparation and conformance to analytical techniques and procedures resulted in good analytical precision for pesticides.

Table D-1. Comparison of Relative Percent Differences (%RPDs) Between Primary and Duplicate Field Soil Samples at theRSA and the ESAs

Analyte	% RPD for the RSA	% Average RPD for the ESAs
Aluminum	0	9.16
Arsenic	6.88	16.64
Barium	0.9	16.58
Calcium	13.41	17.39
Cobalt	15.7	8.04
Chromium	15.86	23.99
Copper	125.56	18.74
Iron	2.83	12.33
Potassium	7.2	13.74
Magnesium	2.84	13.18
Manganese	12.22	7.23
Sodium	13.2	8.73
Nickel	16.92	31.06
Lead	6.76	28.47
Vanadium	2.13	12.79
Zinc	14.36	18.17

Table D-2. Relative Percent Differences (%RPDs) for Field Duplicates in Soil at ESA-1 and ESA-2

	%RPDs	
Chemical Class	Range	Average
SVOCs	0.00 - 56.0	22.14
Pesticides/PCBs	0.00 - 24.62	13.76
Dioxins/Furans	9.89 - 50.54	29.24
Cyanide	-	23.66
Metals	0.24 - 112.44	16.25

Analytical precision was acceptable for the semivolatiles detected in the ESA soils spiked with surrogate compounds. RPDs calculated between pairs of matrix spike and matrix spike duplicates are listed in Table D-4. Proper laboratory preparation and conformance to analytical techniques and procedures resulted in analytical precision for the RPDs for semivolatiles. Acceptable laboratory precision with surrogate spikes also indicates that there is minimal analytical interference from the choice of selected surrogates introduced into the sample.

Table D-3. Evaluation of Relative Percent Difference (%RPD) Between MS/MSD Pairs for Pesticides in Soils at the ESAs

		% RPD	
Pesticide	**Symbol**	**Range**	**Average**
Alpha-chlordane	ACLDAN	10.53	10.53
Alpha-endosulfan	AENSLF	1.36 - 113.15	31.67
Aldrin	ALDRN	2.38 - 113.52	30.42
Chlordane	CLDAN	10.19	10.19
Dieldrin	DLDRN	0.40 - 109.85	31.45
Endrin	ENDRN	5.52 - 112.24	31.70
Endrin Aldehyde	ENDRNA	41.86	41.86
Endrin Ketone	ENDRNK	18.37 - 89.11	53.74
Gamma Chlordane	GCLDAN	10.43	10.43
Heptachlor	HPCL	1.22 - 110.58	25.38
Lindane	LIN	0.98 - 111.51	29.53
Methoxychlor	MEXCLR	3.51 - 111.68	28.48
2,2 Bis(para-chlorophenyl)-1,1,1-trichloroethane	PPDDT	2.31 - 105.98	33.27

Table D-4. Evaluation of Relative Percent Difference (%RPD) Between MS/MSD Pairs for SVOCs in Soils at the ESAs

		% RPD	
SVOC	**Symbol**	**Range**	**Average**
1,2,4-Trichlorobenzene	124TCB	8.70 - 24.30	12.79
1,4-Dichlorobenzene	14DCLB	4.71 - 25.77	12.31
2-Chlorophenol	2CLP	2.35 - 25.00	9.66
Acenaphthene	ANAPNE	1.09 - 22.22	7.25
N-Nitroso-di-n-propylamine	NNDNP	2.15 - 14.46	8.64
Pentachlorophenol	PCP	3.33 - 29.51	11.82
Pyrene	PYR	8.00 - 26.09	13.12
Phenol	PHENOL	6.45 - 14.29	9.64

Analytical precision was acceptable overall for the MS/MSD pairs of soil spiked with target analytes. Average RPDs for target analytes for all six chemical classes ranged from 1.59 to 28.35 (Table D-5). Very good precision was achieved for cyanide, dioxin, explosive, and semivolatile target analytes.

Table D-5. Evaluation of Relative Percent Difference (%RPD) Between MS/MSDs in ESA Soils Spiked with Target Analytes

Analyte Group	Range (% RPD)	Average (% RPD)
Cyanide	0.58 - 29.9	13.3
Dioxins	0.00 - 16.2	3.51
Explosives	0.00 - 4.78	1.59
Metals	0.00 - 130	9.37
Pesticides/PCBs	0.40 - 113	28.35
SVOCs	1.09 - 29.5	10.65

A single high RPD value for silver (130 percent) increased the average of the remaining metal RPDs by nearly 58 percent. Removing the single outlier significantly decreased the average RPD for metals from 9.37 to 4.00 percent.

RPDs for pesticides were generally up in the middle 40 percent range. However, RPDs for pesticides from ES1-94-09 are high, ranging from 105.98 to 113.52 percent. Because these values are high compared to the other RPDs for pesticides at other ESA locations (Refer to Appendix G), either the reported value for the MS or the MSD may be in error, subsequently affecting the RPD. However, none of the data were qualified, and all data are considered useable.

Additional MS/MSD information for the summarized RPD data for soils is presented in the Ecochem DQA in Appendix G.

Soils: Accuracy. Laboratory accuracy was assessed through the use of sample spikes and QC samples. For example, a sample (or blank) may be spiked with an organic or inorganic compound of known concentration and the average percent recovery (%R) calculated as a measurement of accuracy. A second procedure is to analyze a standard (e.g., SRMs, certified reference materials, continuing calibration standards) and calculate the percent difference (%D) between the measured value and the certified value of the standard.

Table D-6 is a summary of the ranges and average %Rs in *standard* matrix spikes, which represent standard soil collected from the Rocky Mountain Arsenal (RMA), spiked and analyzed with each lot of soil samples. Data were all acceptable with good to excellent recoveries for all chemical classes, with few data qualifiers.

Table D-6. Evaluation of Percent Recovery (%R) in Standard Matrix Spikes (Soil Sampling)

Analyte	No. of Data Points Evaluated	Minimum %	Maximum %	Average %
Cyanide (soil matrix)	15	10.4	106.0	88.4
Cyanide (water matrix)	18	87.0	101.0	97.0
Metals (soil matrix)	264	77.3	133.0	100.0
Metals (water matrix)	183	79.5	145.0	106.0
Pesticides/PCBs (soil matrix)	88	39.2	116.0	77.5
Pesticides/PCBs (water matrix)	66	85.4	266.0	124.0
SVOCs (soil matrix)	100	58.0	152.0	88.2
SVOCs (water matrix)	80	25.0	120.0	68.1
Explosives (soil matrix)	105	68.0	125.0	103.0
Explosives (water matrix)	105	60.2	122.0	91.2

Note: 3 spikes are analyzed with each lot- 2 high spikes, 1 low spike.

As a class, the semivolatiles averaged 88.2 percent recovery (soil matrix). The average %Rs for the other four chemical classes (cyanide, explosives, metals, and pesticides/PCBs) ranged from 77.5 percent to 106.0 percent. More detailed information for the percent recoveries for all standard matrix spikes and natural MS/MSDs in soil are found both in the soil analytical results section of this Appendix and Appendix G.

Compared to the standard matrix spikes, there was more variability in the %R in the *natural* (soil) matrix spiked with target analytes (Table D-7 and Table D-8). No outlier tests were performed for the calculations of percent recovery, therefore the data reflect negative values. For compounds in several of the chemical classes, the %R variability was seen both within a chemical class and between chemical classes. For cyanide, %Rs for natural MS and natural MSDs ranged from 7.60 percent to 1,017 percent.

Table D-7. Summary of Percent Recovery (%R) in Natural Matrix Spikes (Soil Sampling)

	MS/MSD %Recoveries		
Analyte	Minimum	Maximum	Mean
Cyanide	7.6	1,017	299.0
Dioxins/Furans	36.5	190.	99.2
Explosives	99	133.44	111.5
Metals	-29,400	19,600	42.5
Pesticides	-26.25	176	75.5
SVOCs	10.52	1,339	149.1

Table D-8. Percent Recovery (%R) in Natural Matrix Spikes (Soil Sampling) (continued)

	Analyte	Number of Data Points	Minimum %R	Maximum %R	Mean %R
	Cyanide	22	7.6	1017.4	299.0

	Pentachlorophenol	20	10.52	107.1	73.2
	Phenol	22	99.57	1245.67	210.6
	Pyrene	20	96.77	214.52	169.3

There was poor agreement between the natural MS and MSD results for the metals. The largest range in %Rs was with iron, which ranged from -29,400 percent to 19,600 percent and averaged a negative 1,004 percent. Poor recoveries may be due to the procedure by which the sample was prepared prior to analysis. Matrix interferences during ICP analysis are likely contributors to this variability.

Pesticides also showed increased variability in %R, but to a lesser extent than cyanide or the metals. Percent recoveries for pesticides ranged from -26.25 percent to 176 percent.

The percent recoveries for the dioxins/furans had previously been calculated low due to an erroneous reporting of spike values by the laboratory. The IRDMIS transfer file had not been corrected by the subcontractor laboratory (Pace Laboratories) and was off by a factor of 1,000. This situation has since been corrected and the recoveries are acceptable as shown in Tables D-7 and D-8.

Field Blanks

Field blanks consisted of deionized water that was poured into appropriate sampling bottles in the field. The analytical results from these samples were used to evaluate contamination introduced by ambient field conditions or sampling procedures. Tables D-9 and D-10 summarize, by chemical class, the contaminants found in the field blanks (range and average concentration). More detailed information on contaminant concentrations in the field blanks is contained in the Soil Analytical Results section of this Appendix.

Table D-9. Contaminants Detected in Field Blanks (Soil Sampling)

Chemical Class	Range (μg/L)	Average (μg/L)
Dioxins/Furans	0.00017	0.00017
Explosives	0.482 - 0.962	0.799
Metals[a]	3.04 - 3.17	3.105
Pesticides/PCBs	0.00338 - 0.00516	0.00427
SVOCs	0.00379	0.00379

[a]Barium results only.

Table D-10. Summary of Analytes Detected in Field Blanks (Soil Sampling)

Blank Identification	Analyte Code	Analyte	Concentration (μg/L)
Dioxins			
3FB-N	TCDD	2,3,7,8 Tetrachlorodibenzo-p-dioxin	0.00017
Explosives			
3FB-A	13DNB	1,3-Dinitrobenzene	0.962
3FB-B	135TNB	1,3,5-Trinitrobenzene	0.482
	13DNB	1,3-Dinitrobenzene	0.771
3FB-C	13DNB	1,3-Dinitrobenzene	0.831
3FB-D	13DNB	1,3-Dinitrobenzene	0.863
3FB-F	13DNB	1,3-Dinitrobenzene	0.884
Metals			
3FB-A	CA	Calcium	193
3FB-C	K	Potassium	1960
3FB-D	CA	Calcium	109
3FB-F	BA	Barium	3.17
	CA	Calcium	203
3FB-H	CA	Calcium	304
	K	Potassium	1580
3FB-I	CA	Calcium	119
3FB-J	CA	Calcium	118
3FB-M	BA	Barium	3.04
	CA	Calcium	113
Pesticides			
3FB-N	ABHC	Alpha-Benzenehexachloride	0.00338
	LIN	Lindane	0.00516
Semivolatiles			
3FB-N	DBHC	Delta-Benzenehexachloride	0.00379

The dioxin TCDD was measured in only a single field blank. Two explosives (1,3-dinitrobenzene and 1,3,5-trinitrobenzene) were detected in six field blanks. Analysis was confirmed in only one of those six. Another four analyses were unconfirmed, and there was sample interference in the last blank.

Analyses for metals in field blanks showed only three metals: barium, calcium, and potassium. Because the ecological risk assessment does not consider calcium or potassium as contaminants, barium, which was measured in just two blanks, was the only metal found in field blanks considered in ecological risk assessment calculations.

Two pesticides, ABHC and lindane, were measured in field blanks. One measurement confirmed that the reported result was above the CRL, the other was an unconfirmed analysis.

A single SVOC (DBHC, which is also a pesticide) was measured; the analysis confirmed the result to be above the CRL in one of the field blanks.

Equipment Rinses

Equipment rinses consisted of water from a USAEC-approved source that was collected from the rinsing of decontaminated equipment prior to the use of the equipment for sample collection. Rinses were collected at a frequency of 1 per day or 1 per 20 samples per equipment type, whichever was the more frequent for each day that samples were collected.

The equipment rinses were analyzed for all requested analytes for that day's sampling activities. The analytical results from these samples were used to evaluate contamination that may be introduced by contact with the sampling equipment. Tables D-11 and D-12 summarize, by chemical class, the contaminants found in the equipment rinses (range and average concentration). More detailed information on analytes detected in equipment rinses is presented in the Soil Analytical Results section of this Appendix and Appendix G.

Table D-11. Contaminants Detected in Equipment Rinses (Soil Sampling)

Chemical Class	Range (µg/L)	Average (µg/L)
Dioxins/Furans	0.00016 - 0.00021	0.000185
Explosives	0.53 - 0.723	0.654
Metals[a]	2.88- 122.0	38.93
Pesticides/PCBs	0.00343 - 0.00626	0.00451

[a]Values for calcium and potassium were not included because they are not considered COPCs.

Table D-12. Analytes Detected in Equipment Rinses (Soil Sampling)

Equipment Rinse No.	Code	Analyte	Result (µg/L)
Dioxins/Furans			
3ER-60	TCDD	2,3,7,8 Tetrachlorodibenzodioxin	0.00021
3ER-61	TCDD	2,3,7,8 Tetrachlorodibenzodioxin	0.00016
Explosives			
3ER-55	13DNB	1,3-Dinitrobenzene	0.688
3ER-56	13DNB	1,3-Dinitrobenzene	0.676
3ER-57	13DNB	1,3-Dinitrobenzene	0.53
3ER-58	13DNB	1,3-Dinitrobenzene	0.723
Metals			
3ER-55	BA	Barium	2.88
	CA	Calcium	242.0
3ER-56	CA	Calcium	115.0
3ER-57	BA	Barium	5.76
	CA	Calcium	228.0
	FE	Iron	122.0
	ZN	Zinc	68.7
3ER-58	BA	Barium	2.88
	CA	Calcium	238.0
	FE	Iron	103.0
3ER-59	BA	Barium	2.88
	CA	Calcium	202.0
	ZN	Zinc	21.5
3ER-60	CA	Calcium	160.0
	K	Potassium	1350.0
3ER-61	BA	Barium	4.56
	CA	Calcium	268.0
	ZN	Zinc	18.9
3ER-62	BA	Barium	3.04
	CA	Calcium	159.0
3ER-63	BA	Barium	3.04
	CA	Calcium	136.0
Pesticides			
3ER-64	ABHC	Alpha-Benzenehexachloride	0.00343
	LIN	Lindane	0.00626
3ER-64	DBHC	Delta-Benzenehexachloride	0.00383

A single dioxin compound, TCDD, was measured in two rinse blanks. Similarly, a single explosive compound (1,3-dinitrobenzene) was measured in four rinse blanks. Analysis was confirmed in only one of those four; the other three values were flagged with a "U" for unconfirmed.

Analyses for metals in rinse blanks showed five metals: barium, calcium, iron, zinc, and potassium. Similar to the situation with field blanks, the only metals in the rinse blanks to be considered in the ecological risk assessment were barium, iron, and zinc. Barium was measured in seven blanks, iron in two blanks, and zinc in three blanks. None of the data were flagged or qualified.

Three pesticides were measured in the rinse blanks. The reported result for alpha-benzenehexachloride was confirmed to be above the CRL in two of the four rinse blanks and unconfirmed in the other two. Delta-benzenehexachloride was detected, and the secondary analysis confirmed the result to be above the CRL in two rinse blanks. Lindane analyses were confirmed in all three blanks in which it was found.

Method Blanks

Method blanks for soil samples were deionized water samples that were analyzed for target analytes in order to evaluate potential contribution of contaminants in the analytical laboratory. Detected concentrations of chemicals do not necessarily mean cross-contamination in the analytical laboratory, but they alert the chemist to possible positive interferences during the analytical process.

A summary of the analytes detected in method blanks is presented in Tables D-13 and D-14. There were seven metals that were detected in the method blanks. Calcium, potassium, and magnesium were not considered metals in this evaluation because they are considered macronutrients for risk assessment purposes. None of the data from the seven metals were flagged or qualified, and the data are considered acceptable for use in the risk assessment.

Table D-13. Summary of Types of Contaminants Detected in Method Blanks (Soil Sampling)

Chemical Class	Range (µg/L)	Average (µg/L)
Metals [a]	1.28 - 1,560	320.15
Pesticides/PCBs [b]	0.00221 - 0.00369	0.00281
SVOCs	0.86	0.86

[a]Calcium and potassium values were not included because they are not COPCs.

[b]Flag codes indicate some pesticides were detected in unconfirmed analyses.

Table D-14. Summary of Analytes Detected in Method Blanks (Soil Sampling)

	Concentration (µg/L)		
Metal	**Minimum**	**Maximum**	**Mean**
Aluminum	536.0	843.0	675.0
Barium	8.13	9.74	8.81
Calcium	244.0	313.0	280.0
Chromium	1.28	1.51	1.395
Iron	1,070.0	1,560.0	1,297.0
Potassium	171.0	281.0	219.0
Magnesium	135.0	184.0	154.0
Manganese	21.5	28.4	24.6
Vanadium	1.94	2.91	2.42
Zinc	3.05	5.39	3.94
Pesticides			
Aldrin	0.00221	0.00369	0.0028
SVOCs			
Isophorone	0.86	0.86	0.86

The pesticide aldrin was detected in three method blanks. However, each of these analyses was flagged as unconfirmed, indicating that, in each case, the confirmatory analyses did not verify the analytical results of the initial analysis. A single semivolatile, isophorone, was measured in a single method blank.

The sampling plans for the SWERA were designed to have samples collected at locations where higher concentrations of contaminants were likely to be found. By intentionally biasing samples in this manner, the most conservative ecological risk evaluation can be performed. Both soil and biota samples were collected in this manner. Because samples were collected using this biased-high approach, it is not appropriate to discuss sampling bias. Analytical bias was not evaluated on a statistical basis.

Containers, Preservation, Storage, and Holding Times[a]

[a]Preservatives and holding times are from *Federal Register*, Vol. 49, No. 209, Friday, October 26, 1984, Page 43, 260 and *Characterization of Hazardous Waste Sites: A Methods Manual - Volume II, Sampling Methods, Second Edition*, EPA-600/4-84-076. Container requirements are consistent with these references.

[b]Sample preservation should be performed immediately upon sample collection. For composite samples, each aliquot should be preserved at the time of collection. When use of an automatic sampler makes it impossible to preserve each aliquot, samples may be preserved by maintaining at 4°C until compositing and sample splitting is completed.

[c]When any sample is to be shipped by common carrier or sent through the U.S. Mail, it must comply with the Department of Transportation Hazardous Materials Regulation (49 CFR Part 172). The person offering such material for transportation is responsible for ensuring such compliance. For the preservation requirements in this table, the Office of Hazardous Materials, Materials Transportation Bureau, Department of Transportation, has determined that the Hazardous Materials Regulations do not apply to the following materials: hydrochloric acid (HCl) in water solutions at concentrations of 0.04 percent by weight or less (pH about 1.96 or greater); nitric acid (HNO_3) in water solutions at concentrations of 0.15 percent by weight or less (pH about 1.62 or greater); sulfuric acid (H_2SO_4) in water solutions at concentrations of 0.35 percent by weight or less (pH about 1.15 or greater); and sodium hydroxide (NaOH) in water solutions at concentrations of 0.080 percent by weight or less (pH about 12.3 or less).

[d]Samples should be analyzed as soon as possible after collection. The times listed are maximum times that samples may be held before analysis and still be considered valid. Some samples may not be stable for the maximum time period given in the table. A laboratory is obligated to hold the sample for a shorter time if knowledge exists to show this is necessary to maintain sample integrity.

[e]P = Polyethylene.

[f]G = Amber Glass with Teflon™-lined cap.

[g]If samples cannot be filtered within 48 hours, add 1 ml of a 2.71 percent solution of mercuric chloride to inhibit bacterial growth.

[h]Maximum holding time is 24 hours when sulfide is present. Optionally, all samples may be tested with lead acetate paper before pH adjustment in order to determine if sulfide is present. If sulfide is present, it can be removed by addition of cadmium nitrate powder until a negative spot test is obtained. The sample is filtered and then NaOH is added to pH 12.

[i]Should only be used in the presence of residual chloride.

[j]For dissolved metals, filter immediately on-site before adding preservative.

[k]Guidance applies to samples to be analyzed by GC, LC, or GC/MS for specific compounds.

[l]S = Glass Vial with Teflon™-lined septum cap

[m]The pH adjustment is not required if acrolein will not be measured. Samples for acrolein receiving no pH adjustment must be analyzed within 3 days of sampling.

[n]When the extractable analytes of concern fall within a single chemical category, the specified preservative and maximum holding times must be observed for optimum safeguard of sample integrity. When the analytes of concern fall within two or more chemical categories, the samples may be preserved by cooling the 4°C, reducing residual chlorine with 0.008 percent sodium thiosulfate, storing in the dark, and adjusting pH 6 to 9; samples preserved in this manner may be held for 7 days before extraction and 40 days after extraction. Exceptions to this optimal preservation and holding time procedure are noted in Footnotes g, m, and n.

[o]If 1,2-diphenylhydrazine is likely to be present, adjust the pH of the sample to 4.0 ± 0.2 to prevent rearrangement to benzidine.

[p]Extracts may be stored up to 7 days before analysis if storage is conducted under an inert (oxidant-free) atmosphere.

[q]For the analysis of diphenylnitrosamine, add 0.008 percent $Na_2S_2O_3$ and adjust pH 7 to 10 with NaOH within 24 hours of sampling.

[r]The pH adjustment may be performed upon receipt at the laboratory and may be omitted if the samples are extracted within 72 hours of collection. For the analysis of aldrin, add 0.008 percent $Na_2S_2O_3$.

[s]Samples receiving no pH adjustment must be analyzed within 7 days of sampling.

Note.—Analytes not listed should be preserved at 4°C and held no longer than 7 days.
